

The Battle of Neighborhoods

This is a report for the capstone project for Applied Data Science Capstone. It includes six sections as follows:

- Introduction
- Data
- Methodology
- Results
- Discussion
- Conclusion

Introduction

Manchester and Liverpool are two major cities in North West England. Both cities are noted for their culture, architecture, musical exports, sports clubs and transport links.

According to Wikipedia (www.wikipedia.org):

* Manchester is the third-most visited city in the UK with a population of 545,500 as of 2017 and with a GDP of \$102.3bn (2015). The economy grew relatively strongly between 2002 and 2012.

According to 2019 property investment research, Manchester is rated as the second location for "The Best Places to Invest in Property In The UK".

* Liverpool is the fifth-largest city in the UK with a population of 2.24 million in 2011 and with a GDP at \$65.8bn (2014). The Economy of Liverpool is one of the largest within the UK.

The important component of Liverpool's economy are the tourism and leisure sectors. Car manufacturing also takes place in the city.

In this project, the above two cities will be compared in details using machine learning segmentation and clustering along with Foursquare data. The objectives include:

- * How similar these two cities are?
- * Which city is better for living for a university student?

Data

In order to apply this study, basic geo data of the two cities need to be collected:

- * Postcode for Liverpool

(https://en.wikipedia.org/wiki/L_postcode_area)

- * Postcode for Manchester

(https://en.wikipedia.org/wiki/M_postcode_area)

The latitude and longitude data also required:

- * (<https://www.freemaptools.com/download/outcode-postcodes/postcode-outcodes.csv>)

Then the data sets for the two cities are ready to be analyzed:

Fig 1. Geocode and postcode for Manchester area

	postcode	latitude	longitude	Post town	Coverage	Local authority area
0	M1	53.477340	-2.235080	MANCHESTER	Piccadilly, City Centre, Market Street	Manchester
1	M11	53.478340	-2.179330	MANCHESTER	Clayton, Openshaw, Beswick	Manchester
2	M12	53.464820	-2.201870	MANCHESTER	Ardwick, Longsight, Chorlton-on-Medlock	Manchester
3	M13	53.460300	-2.213890	MANCHESTER	Ardwick, Longsight, Chorlton-on-Medlock	Manchester

24	L30	53.484420	-2.970620	BOOTLE	Bootle, Netherton	Sefton

Methodology

In this section, the Foursquare API will be applied to explore neighborhoods in both cities, Manchester and Liverpool. Then, the most common venue categories in each neighborhood will be explored. K-means clustering algorithm will be used to group the neighborhoods into clusters. Clustered data will be presented by using the Folium library.

Import necessary Libraries

```

import requests # library to handle requests
import pandas as pd # library for data analysis
import numpy as np # library to handle data in a vectorized manner
import random # library for random number generation

!conda install -c conda-forge geopy --yes
from geopy.geocoders import Nominatim # module to convert an address
into latitude and longitude values

# libraries for displaying images
from IPython.display import Image
from IPython.core.display import HTML

# tranforming json file into a pandas dataframe library
from pandas.io.json import json_normalize

!conda install -c conda-forge folium=0.5.0 --yes
import folium # plotting library

print('Folium installed')

print('Libraries imported.')

Define Foursquare Credentials and Version
CLIENT_ID = '40TA5YCVA3CXTBIWMNPDMBKLDL404BVC5E4BFN5KXKMMKHL4' #
Foursquare ID

```

```

CLIENT_SECRET =
'OFICYUUXDQKDMPHZOTTNFIWVMK5EFL23D01HPXN2SKZMBJZM' # Foursquare
Secret
VERSION = '20180604'
LIMIT = 30

print('My credentails:')

print('CLIENT_ID: ' + CLIENT_ID)
print('CLIENT_SECRET:' + CLIENT_SECRET)

```

Since we now have all the data we need in hand, we can explore it for a test before we conduct our main project. Suppose there is a student who loves Chinese food and get offers from The University of Liverpool and The University of Manchester. The number of Chinese restaurant around the university is a factor that student consider with. Let's have a look.

Chinese restaurants around The University of Liverpool

```

address_1 = 'Chatham St, Liverpool L69 7ZN'

geolocator_1 = Nominatim(user_agent="foursquare_agent")

location_1 = geolocator_1.geocode(address_1)
latitude_1 = location_1.latitude
longitude_1 = location_1.longitude

print(latitude_1, longitude_1)

53.4001881 -2.9644371

search_query= 'Chinese'
radius_1 = 1000
print(search_query + ' .... OK!')
url_1 =
'https://api.foursquare.com/v2/venues/search?client_id={}&client
_secret={}&ll={},{}&v={}&query={}&radius={}&limit={}'.format(CLI
ENT_ID, CLIENT_SECRET, latitude_1, longitude_1, VERSION,
search_query, radius_1, LIMIT)

url_1

results_1 = requests.get(url_1).json()

results_1

```

Here's what we found:

Fig 3. Chinese restaurant around the University of Liverpool

- 0 Campus real Chinese restaurant
- 1 Lida Chinese supermarket
- 2 Arch Chinese Restaurant And Takeaway
- 3 Hondo Chinese Supermarket
- 4 Mabo Chinese restaurant
- 5 SIDA Chinese Supermarket
- 6 favorite Chinese take away
- 7 Mr Chilli Chinese Restaurant
- 8 Liverpool Chinese Gospel Church
- 9 SIDA Chinese Supermarket
- 10 Chung Wah Supermarket
- 11 Mei Mei

Fig 4. Map of Chinese restaurant around the University of Liverpool

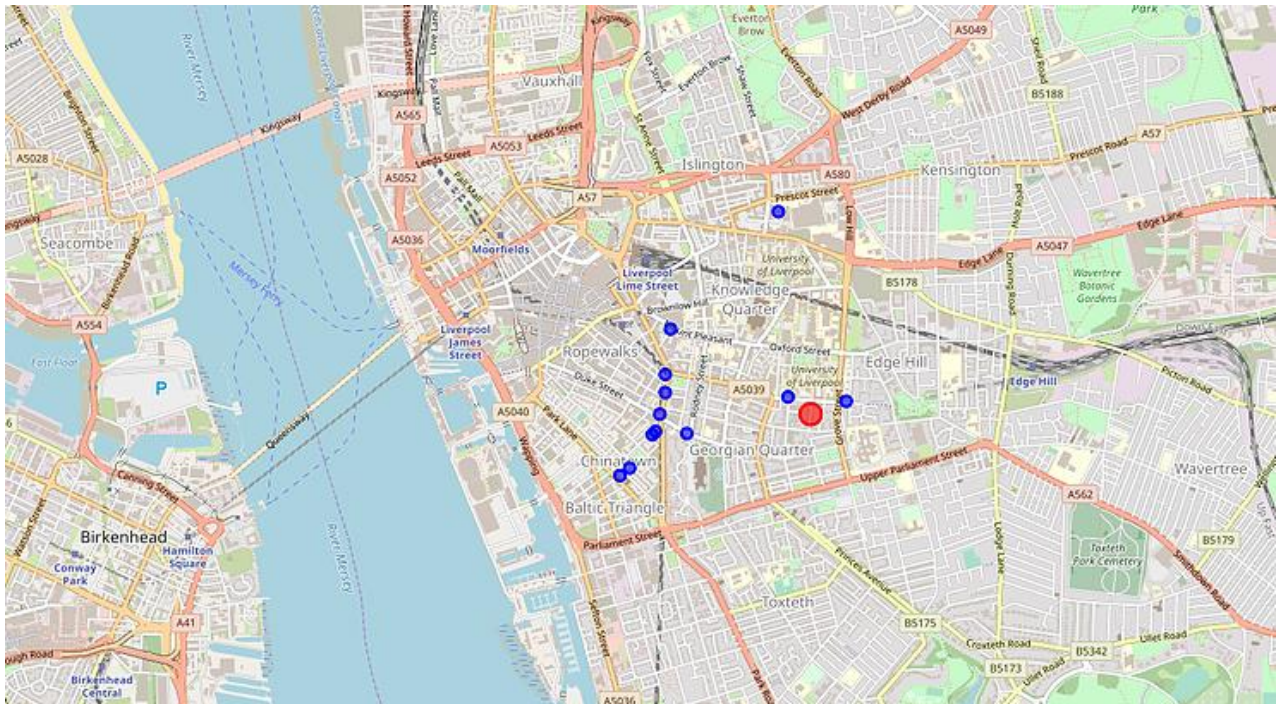

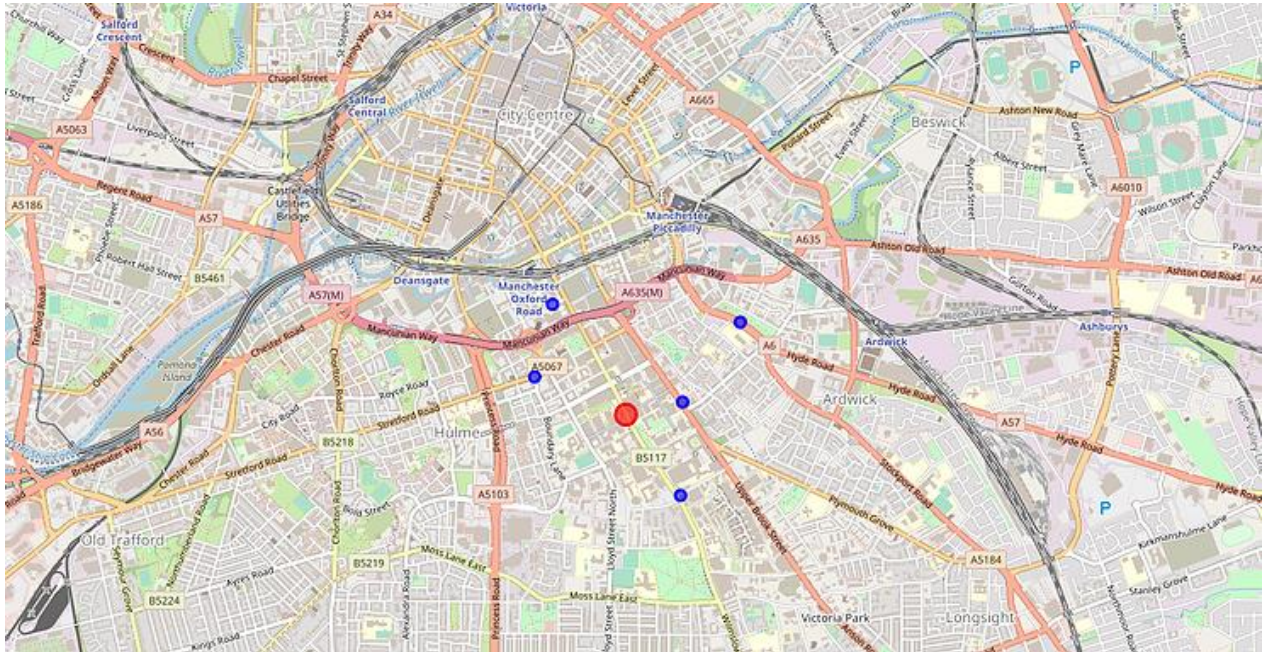

Fig 5. Chinese restaurant around the University of Manchester

- 0 Tai Pan Chinese Restaurant | 喜臨門大酒樓
 - 1 Red Chilli Chinese Restaurant | 紅椒京川菜館
 - 2 Azuma Chinese Restaurant
 - 3 Lameizi Chinese Supermarket & Restaurant
 - 4 Manchester Chinese Centre
- Name: name, dtype: object

Fig 6. Map of Chinese restaurant around the University of Manchester

It seems worked very well. Ok, now let's check **all venues for the two cities.**

Fig 7. Venues in Liverpool, by venue category

K-mean Cluster

Now, we can try to classify the clusters for each neighborhood. Let's set the number of clusters is three.

```
from sklearn.cluster import KMeans
# set number of clusters
lclusters = 3
l_grouped_clustering = l_grouped.drop('Area', 1)
# run k-means clustering
kmeans = KMeans(n_clusters=lclusters,
random_state=0).fit(l_grouped_clustering)
# check cluster labels generated for each row in the dataframe

kmeans.labels_[0:10]

kmeans.labels_

len(kmeans.labels_)

#create a new dataframe that includes the cluster as well as the top 10 venues for each neighborhood.
# add clustering labels
l_merged['Cluster Labels'] = pd.Series(kmeans.labels_)
# Matplotlib and associated plotting modules
import matplotlib.cm as cm
import matplotlib.colors as colors
#Finally, let's visualize the resulting clusters
# create map
l_clusters = folium.Map(location=[53.40254, -2.97928],
zoom_start=13)
lclusters = 3
# set color scheme for the clusters
x = np.arange(lclusters)
ys = [i+x+(i*x)**2 for i in range(lclusters)]
colors_array = cm.rainbow(np.linspace(0, 1, len(ys)))
rainbow = [colors.rgb2hex(i) for i in colors_array]
l_merged= l_merged.fillna(0)
l_merged['Cluster Labels']=l_merged['Cluster
Labels'].astype(int)
# add markers to the map
markers_colors = []
for lat, lon, poi, cluster in zip(l_merged['latitude'],
l_merged['longitude'], l_merged['Area'], l_merged['Cluster
Labels']):
    label = folium.Popup(str(poi) + ' Cluster ' + str(cluster),
parse_html=True)
```

```

folium.CircleMarker(
    [lat, lon],
    radius=5,
    popup=label,
    color=rainbow[cluster-1],
    fill=True,
    fill_color=rainbow[cluster-1],
    fill_opacity=0.7).add_to(l_clusters)

l_clusters

```

Discussion

As mentioned in the Introduction section, both of the two cities are important and popular in the UK. With what we've calculated and mapped in the last section, we can briefly classify the clusters of the two cities using the data of the most common venue.

For Liverpool, cluster 1 is likely for tourism as the cluster 1 of Manchester, cluster 2 is for residential and cluster 3 is mixed of leisure and residential. For Manchester, cluster 1 is more likely for leisure/tourism (bar&pub), cluster 2 is for residential and cluster 3 is for shopping. Based on the clusters calculated, we can draw a conclusion that the two cities are similar in terms of the common venues.

There are several possible explanations for this result. Both of the two cities have highly-reputed football clubs and museums, therefore, both of them attract people to visit. There are also high ranked universities located in the two cities, so this preliminary finding also suggests that the two cities are suitable for residential.

In addition, if you are a university student live around the University and also like Chinese food then Liverpool provides you more choices than Manchester :)

Conclusion

This project compared two big cities in the North of England, classified the area in the city whether it's for residential, social or others. This was derived using Foursquare data. So the limitation is it was not a all through comparison. We can not jump into a conclusion that which city is better than another.

In the future, we need to consider use other quantitative data such as living cost, house price and job market etc to have a further exploration.
